

Detailed notes on the course of the stations:

1. The same simulators on which students practice in SimCenter (adult, child, infant/newborn) will be used for the OSCE station.
2. You should ask Big Brother for aspects of the physical examination that cannot be examined on the simulator (examples: skin colour, oedema, neurological examination, internal organs of the abdominal cavity, etc.). Simulator tremors / convulsions look the same regardless of their characteristics or cause (the simulator "can't" vibrate otherwise).
3. During the station (as opposed to the simulation scenarios in paediatrics and internal medicine) it is not obligatory to remove the medicine package and draw it into the syringe.
4. The form and method of administration of the medicine are mandatory.
5. During the station, the student must report loudly what he is doing, including the tests he orders, consultations, prescriptions and diagnosis. This is necessary for the proper evaluation of a given station.
6. The student will receive all the necessary tests results / consultations after ordering them. If any tests or consultations are not needed to complete the station, the student will be informed that they will be available in an hour.
7. During the station we do not fill in any personal data (e.g. name, surname, etc.),
8. On the prescription, we write only the name of the medicine (international or commercial) and the form. We do not write refunds, government numbers, etc.
9. Information about the decision on qualification for vaccination is announced loudly at the end of the station with the words "I qualify or not for vaccination against . . . "
10. The equipment available in the room depends on the specifics of the scenario and is sufficient to complete the task. If a student has any doubts, he/ she can address the Big Brother.
11. During the station, additional help should not be expected, if a team member is necessary to complete the task, the student will be informed about it before entering the room.
12. At the "glucose measurement" station, the entire measurement procedure should be carried out; only the finger prick of the simulator should be simulated. During other stations, you can ask Big Brother about the blood glucose result.
13. Please remember to be safe when using the defibrillator.
14. Technical problems will never be an obstacle to completing the station, if you are not sure what you have found, you can ask Big Brother.
